

ASSIGNMENT 1: REQUIREMENT ELICITATION

Food Delivery System

Functional Requirements

Customers

1. The system should allow customers to place orders for food from various restaurants.
2. The system should provide a menu for each restaurant.
3. The system should allow customers to customize their orders (e.g., add/remove items, specify preferences).
4. The system should allow customers to track the status of their orders.

Kitchen Staff

1. The system should allow kitchen staff to view incoming orders.
2. The system should allow kitchen staff to update the status of orders (e.g., preparing, ready for delivery).
3. The system should allow kitchen staff to manage the menu items (add, update, remove).
4. The system should allow kitchen staff to view order history.

Restaurant Owners

1. The system should allow restaurant owners to manage their restaurant profiles.
2. The system should allow restaurant owners to view sales reports and analytics.
3. The system should allow restaurant owners to manage their menu items and prices.
4. The system should allow restaurant owners to respond to customer feedback.

Delivery Personnel

1. The system should allow delivery personnel to view assigned orders.
2. The system should allow delivery personnel to update the status of orders (e.g., out for delivery, delivered).

Non-Functional Requirements

Performance

1. The system should handle a lot of simultaneous users without performance degradation.
2. The system should process orders within a few seconds on average.

Usability

1. The system should have an intuitive user interface for customers, restaurants, and delivery personnel.
2. The system should provide help and support features for users.

Security

1. The system should ensure secure transactions and protect user data.
2. The system should implement authentication and authorization mechanisms for different user roles (customers, restaurants, delivery personnel).

Scalability

1. The system should be able to scale horizontally to accommodate an increasing number of users and orders.

2. The system should support adding new restaurants and delivery personnel without significant downtime.
